

HorizoN

Horizon, is Afferent Software's flagship payments monitoring and business intelligence solution.

Monitoring and drawing business intelligence from payments switches has traditionally been extremely limited using out-of-the-box functionality. The alternatives, using traditional purpose-built solutions, are typically over-complicated, inflexible and expensive often leading organisations to resort to building tailor-made software themselves. This can serve them well, however often the knowledge to update these custom-built solutions is lost over time as people move on. The user experience and functionality is also often limited by the experience and time of the staff involved.

Horizon by Afferent Software is built on the latest web technologies to provide a modern, highly visual, intuitive, customizable view of most of the available transaction and terminal data within payments switches, with a focus on Postilion.

If you're interested in using this payments solution, or want to find out a bit more about this product, join our mailing list or watch this space.
